

ABSTRACT**~~Device for lock-fixing an apparatus designed to be mounted in a rack~~**

The present invention relates to a lock-fixing device of an apparatus designed to be mounted in a rack, and relates in particular to the fixing of radio electric or electronic apparatus, with the aid of a fixing of the "lock" type. It applies in a particularly advantageous manner to so-called "onboard" apparatus. The fixing device comprises first [(13)] and second [(22)] fixing elements secured respectively to the apparatus and the rack, the first element being moved by the operation of a handle [(14, 14a)] in order to interact with the other element to fix the apparatus in the rack, and also comprises a mechanism [(15, 15a)] for locking said handle. According to the invention, the handle (14) has a gripping member [(141, 141a)] connected to a handle body [(142)] situated on one side [(12)] of the apparatus and the locking mechanism comprises a sliding hook [(151)] serving as an abutment to said handle body in the locked position.
